Click the down arrow next to the application's language setting and then click the Keyboard tab. In the Keyboard Language Settings, select the desired keyboard layout. To change the keyboard settings: Start the application. The application's language setting will be at the top of the window. Select the language you want to use. To change the keyboard language hotkey: Click the down arrow next to the application's language setting. Click the Accessibility Settings button. Click the Hotkeys tab.

What's New In?

Script runs under Windows NT, 2000 or XP and includes Control Panel and Registry entries. It can be run as a batch file or a VBS script. Welcome to the HindiEditor (Hindi language support for Windows) project! This script is part of the Windows Vista Native Language Support. You can get more information about this project from the above link. To get started, just double-click on the script. Installation: Windows 2000 and XP users: Download the attached file from the above link. Note: This file needs to be run from the command line as an executable to enable Hindi text support. Run the script from the command line using a batch file: C:\> "C:\Scripts\HindiEditor.vbs" or if you wish to use as a VBS script: C:\> "C:\Scripts\HindiEditor.vbs" Alternatively if you are running Windows NT you can use the Control Panel option "WinNT/Spooler" for the Language tab. To automatically enable Hindi text support at startup: Either start the script using a batch file, or add it to the AutoStart list under the Control Panel "Start" tab. Note: If you are using Windows NT and you wish to disable the hotkey of Hindi text support, instead of enabling it, you can add a keybinding in the Start menu to disable it. See the detailed instructions at the below link. Note that the script requires the Windows NT/2000/XP languages to be set to "Hindi" and not the one set to "English". Note: Although the script shows a warning message when running on Windows NT/2000/XP, actually it does not run when the above language is set to "English". The warning message appears only when the language is set to "Hindi". To un-install the script: Click on the image below for more details. [hr] How to use this script: 1. Select the "Install" button to start the installation of the script. 2. After the installation is complete, the dialog will show a warning message. In order to proceed, click on the "Next" button. 3. The next dialog will show the [hr] text which indicates the completion of installation. Click on "Finish" to complete the installation. By default HindiEditor.vbs is installed in the "Scripts" folder. However if the HindiEditor.exe executable is present in the same folder then the script will automatically check for that file and load it into the script. If you are a Windows 2000 and XP user, you can customize the HindiEditor.exe to enable Hindi text support in "WinNT/Spooler/Language/H
